TABLE XVII.

THE POPULATION BY CASTE, TRIBE, OR RACE.

EXPLANATORY NOTE.

In this return the term Caste, Tribe, or Race, as the case may be, is used to denote, as a rule, an endogamous community, and subdivisions have generally been included under the main heading. There are, however, exceptions to be found in both cases, which it is impracticable to avoid recognising. Religious denomination has been omitted, except where it is the only means of demarcation, as in the case of those converts to Christianity who may have abandoned their caste.

The classification is based on considerations partly ethnological, partly historical, and partly, again, functional. The second predominate, for instance, in the first caste group, and the last throughout the middle of the return; but, wherever practicable, as it is in the later portion of the scheme, ethnological distinctions have been maintained. Then, again, it must be mentioned that the functional grouping is based less on the occupation that prevails in each case in the present day than on that which is traditional with it, or which gave rise to its differentiation from the rest of the community.

The object of prescribing a uniform scheme of classification for countries admittedly so various in the detail of the distribution of their population as are the different parts of India, is chiefly to obtain the best means of appreciating this diversity and, in a minor degree, to facilitate the compilation of so heterogeneous a mass of figures into a single return for the whole Dependency. This intention, however, has been to some extent frustrated by the delay in furnishing the figures for the two large Provinces of Bengal and the North-West, with their States, none of which were received until several months after the rest had been compiled by their respective groups, and reduced to proportional form.

As the general rule in preparing this return was to locate the caste, &c. according to the traditional occupation ascribed to it in the province where it is most numerously represented, the late arrival of lists involving so large a population necessitated changes in the work already done which it was impossible to carry into the full detail of Table XVII. within a reasonable time. Such changes, accordingly, have been effected in the first section of Table XVII., but the original grouping is retained in the second section, which treats of the subject in Provincial detail, and in Table XVIII., where it is dealt with in connection with literacy and infirmities. A few instances, too, of inconsistent classification, irrespective of the above cause, have been found in the course of final scrutiny, but too late for correction.

TABLE XVII.

ART A.—GENERAL SUMMARY.

Group and Chief Items.	Numerical Strength.	Territorial Distribution.
I. Military and Dominant, now Agricultural.	29,393,870	
1. Rājput - - -	10,424,346	Universal, but less in the south and east.
2. Jat - - -	6,688,733	Panjab, 4,625,523; Rājputāna, 1,056,160; N.-W. Prov., 701,259; Kashmēr, 142,595; Cent. India, 56,530; Sindh, 45,526.
3. Gūjar - - -	2,171,627	Panjab, 711,800; N.-W. Prov., 345,978; Rājputāna, 573,003; Kashmēr, 248,789; Cent. India, 204,511.
4. Awān - - -	616,328	Panjab, 608,051; Kashmēr, 8,034.
5. Khókhar - - -	140,102	Panjab, 139,964.
6. Káthi - - -	34,996	Kathiawar (Bombay).
7. Ghakkar - - -	28,771	Panjab.
8. Mēo - - -	365,726	Panjab, 120,578; Rajputāna, 145,258; N.-W. Prov., 78,353.
9. Tāga - - -	140,529	Panjab, 11,966; N.-W. Prov., 128,563.
10. Bhuinhār - - -	229,157	N.-W. Prov., 221,031; Cent. Prov., 8,126.
11. Bābhān - - -	1,222,674	Bengal.
12. Marátha - - -	3,324,095	Bombay, 2,122,576; Haidrabād, 969,340; Madras, 73,871; Mysore, 44,444; Cent. India, 35,608; Cent. Prov., 32,571.
13. Vēllama - - -	479,783	Madras, 381,868; Haidrabād, 94,094; Bombay, 2,799.
14. Khandait - - -	671,272	Orissa.
15. Marawa - - -	313,881	Madras.
16. Kalla - - -	410,983	Madras.
17. Nāir - - -	980,860	Madras, 979,185; Coorg, 1,097.
18. Agamudia - - -	296,677	Madras, 296,299.
19. Kódaga - - -	32,641	Coorg, 32,611.
<i>Others</i> - - -	513,689	
II. Landholders - - -	47,927,361	
1. Kánbi and Kúrmī - - -	10,531,300	Bombay, 3,577,873; N.-W. Prov., 2,035,768; Haidrabād, 1,233,930; Berar, 834,432; Cent. Prov., 805,766; Bengal, 1,321,628.
2. Māli - - -	1,876,211	Bombay, 313,084; Rajputāna, 381,164; N.-W. Prov., 270,719; Panjab, 201,189; Berar, 202,488; Bengal, 151,962; Cent. Prov., 141,086.
3. Lólha - - -	1,674,098	N.-W. Prov., 1,065,025; Cent. Prov., 293,110; Cent. India, 252,658.
4. Kúchhia - - -	1,384,222	N.-W. Prov., 706,530; Cent. India, 472,134; Cent. Prov., 122,646.
5. Kúnjra - - -	222,517	Bengal, 126,761; N.-W. Prov., 86,045.
6. Mārao - - -	677,982	N.-W. Prov.
7. Aráin - - -	918,964	Panjab, 896,314; Kashmēr, 22,243.
8. Kamboh - - -	160,380	Panjab, 151,160; N.-W. Prov., 9,220.
9. Sāini - - -	224,777	Panjab, 125,352; N.-W. Prov., 99,425.
10. Kanēt - - -	369,764	Panjab.
11. Rathī - - -	109,844	Panjab, 100,929; Rajputāna, 8,915.
12. Ghirath - - -	173,673	Panjab.
13. Sāmo / - - -	399,498	Sindh, 397,117; Bombay, 2,381.
14. Kōeri - - -	1,735,431	Behār, 1,195,186; N.-W. Prov., 540,245.
15. Barai - - -	464,208	Bengal, 249,841; N.-W. Prov., 153,459; Cent. Prov., 24,614; Assam, 22,797.
16. Kaibartta - - -	2,298,824	Bengal, 2,231,500; Assam, 67,324.
17. Sadgōp - - -	571,335	Bengal.

TABLE XVIII.

LITERACY AND INFIRMITY BY CASTE.

EXPLANATORY NOTE.

In this return the castes are grouped as in Table XVII., and against each group is shown, first, the number returned as literate, distinguishing those who can read and write English, and, secondly, those returned as suffering from any of the four infirmities specified in Tables XII. to XV. in Volume I.

As in several tracts the above particulars were not included in the census inquiry, the summary for India, as a whole, is subdivided into three parts. In Part A., those returning caste at all are grouped by sex, and two columns are added, showing the strength of each group relatively to the total population included in the return, and the average number of females in it to 1,000 males. Part B. includes only the population returning literacy and deaf-mutism, and thus excludes Central India, Kashmér, Rajputána, and a few hill tracts elsewhere. Part C. includes Rajputána, but excludes the rest of the above-named tracts, and gives particulars of the three remaining infirmities.

Part D. shows the distribution by caste of the population of each territorial unit, but, to save space, the groups are made more comprehensive than in the rest of this table and in that which precedes it.

It will be noted that in two or three provinces the figures for infirmities differ from those given in the tables in Volume I. The alteration was made at the final revision of the returns in the local census offices, after the first series of the Imperial tables had been closed.

TABLE XIX.

PROPORTIONAL REDUCTION OF THE
CASTE RETURN.

EXPLANATORY NOTE.

This table is merely supplementary to the last, and is intended to facilitate the comparison of group with group and Province with Province, in respect to the distribution of caste and of literacy and infirmity by caste. Part A. treats of the ratio of the group-population to the total, and of females to males in the group. As these relative figures have been given for India, as a whole, in the preceding Table, they are not repeated. In Part B., literacy, without distinction of sex, and amongst the males only, is shown. The remaining portion of the return deals with the four selected infirmities.

TABLE XIX. (A.)

(a.) Ratio of Group to 10,000 of Population, and
 (b.) The Number of Females to 1,000 Males in each Group.

T A B L E X X.

SUBDIVISIONS OF PROVINCES AND STATES.

EXPLANATORY NOTE.

In the Provincial and State volumes the unit of compilation is the district or subdivision; so, for convenience of reference, it has been thought worth while to append to the Imperial series of returns, a statement of the area and population, with a few other leading statistics, of the above details of the political divisions which are taken as the unit in the General Tables. In the case of Rajputána, the area is that first returned from the Agency Office. It has since been revised, apparently, as the Provincial Report shows different figures, but, as there seems to be some uncertainty about the matter, uniformity with the General Tables has been maintained.

TABLE XX.—TERRITORIAL SUBDIVISIONS.

APPENDIX III.

NOTE

ON

AGE DISTRIBUTION IN INDIA

AND

RATE OF MORTALITY;

WITH

LIFE TABLES,

BY

G. F. HARDY, F.I.A., F.S.S.

NOTE ON
AGE DISTRIBUTION AND RATES OF
MORTALITY;
WITH LIFE TABLES,

BY

G. F. HARDY, F.I.A., F.S.S.

1. On the occasion of the Census of 1881 tables were constructed based upon the age returns and the estimated rates of increase in the principal provinces, showing the numbers living, the average rates of mortality, and average duration of life at each age. The results thus deduced were intended to represent an average state of things as regards age distribution and mortality for each province, taking one period with another. On the present occasion tables have been constructed similar in form to those given in the 1881 Report. The figures are intended to refer, however, to the 10 years intervening between the two censuses, and to show the rates of mortality that have prevailed at the various ages during that period, and the expectations of life, assuming such rates to be permanent. Seeing that the period in question has been free from famine, with its accompanying disturbance of the birth and death-rates and the rates of increase, a material difference may be looked for in the resulting figures.

2. The data employed in the present investigation are in the main of the same character as those upon which the previous tables were based. The registration returns of births and deaths are still far too imperfect, except in a few special districts, to be employed for obtaining either the rates of mortality prevailing amongst the population generally, or the rate at which the population is increasing in the various provinces. The registered deaths would probably show the relative mortality at various periods of adult life, if the ages returned could be depended upon; but unfortunately this is not the case, and it is impossible to say to what extent the results would require correction, on account of the abnormal number of deaths returned at the decennial ages.

The data employed in the construction of the mortality tables appended are:—

- (1.) The general age returns of the 1881 and 1891 Census, showing the population of both sexes for quinquennial groups of ages.
- (2.) Special returns showing the numbers living at each age in 1891 according to certain specimen schedules (varying from about 30,000 to 100,000 in number) for the various provinces. These returns were new to the present census, and were of the greatest assistance in the adjustment of the age tables, showing at once the extent to which the quinquennial returns are disturbed by the inaccuracy of the stated ages.
- (3.) The observed rates of increase in the various provinces during the 10 years 1881–91, corrected where necessary for the effect of migration by means of the birthplace tables.
- (4.) The mortality rates for the first 12 years of life, deduced from the registration returns of the “Proclaimed Clans” in the North-West Provinces, which were described in the 1881 Census Report.

The only provinces with which it was thought both desirable and practicable to deal were Madras, Bombay, Bengal, North-West Provinces and Punjab. Burma would have been included, but it was found that the great uncertainty as to the extent to which the observed increase was due to immigration, and the ages at which the immigrants entered would render any results of extremely doubtful value.

Adjustment of the Age Tables.

The first step in the process of deducing the mortality tables was to compute tables showing as nearly as possible the average age distribution in the provinces named. For this purpose the numbers returned in the quinquennial age groups for each province were redistributed amongst the individual ages in proportion to the numbers at those ages in the specimen schedules; they were then reduced proportionally to represent a total population of 100,000 of each sex, and the resulting figures are shown in Table A. This table may, therefore, be taken to represent with a considerable degree of accuracy the relative numbers actually returned at each age at the 1891 Census in the provinces named.

There are three sources of errors in the age tables, the first and most obvious of which is the fondness for decennial (and, in a minor degree, quinquennial) ages shown in the returns; and indeed a general preference for even numbers. A brief inspection of Table A. will show the extraordinary extent to which this tendency to return decennial and quinquennial ages affects the general age tables, a single illustration of which will suffice. It would appear from the census returns that (out of a total male population of 100,000) 4,999 were over 60 in the North-West Provinces, and only 3,253 in the Punjab, or about one-third less. In the latter province, however, the ages were returned as at next birthday, while in the remaining provinces they were returned as ages last birthday. Consequently in the North-West Provinces, the 2,503 males returned as aged 60 last birthday (whose real ages were perhaps anything between 50 and 70), were included in the census as 60 and upwards; while in the Punjab, the 3,152 males returned as aged 60 next birthday (their real ages being probably much the same as those of the similar group in the North-West Provinces), were included in the group 55 to 59. The following will then show the apparent as contrasted with the probably true state of the case:—

		Numbers over 60 out of Population of 100,000 Males.	
		Census Age Tables. (Uncorrected)	Corrected for Age Misstatement.
North-West Provinces	- -	4,999	3,747
Punjab	- - - -	3,253	4,820

As a preliminary step in the adjustment of the age tables, these excess numbers at the quinquennial ages were distributed equally over the adjacent five-years' groups. The method of procedure was as follows:—

In the Madras Table (males), it will be seen, for example, that there were enumerated (out of a male population of 100,000)—

At age 29	- - - -	355
„ 30	- - - -	6,386
„ 31	- - - -	221

A mean of the numbers at ages 29 and 31 is one-half $(355 + 221) = 288$. It was therefore assumed that this number of males knew and correctly returned their ages at 30 last birthday; but that the remaining 6,098 merely estimated their ages, more or less roughly, at that figure. One-half of these were assumed to be under 30, and one-half over that age. The numbers at all other quinquennial ages having been similarly treated the resulting figures are summarised in Table C.; similar and equal corrections having been applied to the 1881 census figures.

In addition to what may be termed the “accidental” errors in the age tables, due merely to fondness for decennial and quinquennial numbers, there are certain “systematic” errors which came out in the process of adjustment consisting mainly of a heaping up of the figures about the period 25–30 at the expense of the preceding

and following ages, and an indubitable tendency to exaggerate the ages after about age 65. There is still a third source of disturbance, due to the low birth-rates of famine periods, which create depressions in the curve at those ages, at which the survivors of such diminished births are living. These systematic errors, as well as the mere irregularities in the progression of the numbers, have been removed by a process of adjustment similar to that described in the 1881 Census Report, Vol. I., page 161. A mean being taken between the 1881 and 1891 figures, preliminary adjustments according to the Makeham-Gompertz formula there described (employing, however, Makeham's additional constant, whereby the logarithm of the population at age x becomes say, $A + Bx + Cx^2 + Kc^x$) were employed as base lines with which the curves were made to coincide at the advanced ages (where the ages returned are probably quite unreliable), the curve during infancy being drawn to accord with the rates of mortality at the younger ages shown by the proclaimed clans (infanticide) statistics given later on. The adjusted results may be taken to show approximately the normal age distribution of the population in the provinces named, and are given in Table C. already referred to. The female tables were treated by a different process which will be described further on. In these returns, with the exceptions perhaps of the provinces of Madras and Bengal, there is reason to suspect a further source of error in the omission of large numbers from the Census; rendering the female tables, with the exceptions named, useless as bases for mortality tables.

MORTALITY RATES DURING CHILDHOOD.

(Proclaimed Clans Statistics.)

These statistics, as already stated, were made use of for adjusting the age tables for the early years of life, and their character is sufficiently described in the 1881 Report. It is sufficient to repeat here that they probably represent for India the average rates of mortality at those ages (for male life) with a fair approach to accuracy. The following table is similar to that given in the report above referred to, but is brought down to date. The facts for the years 1888-90 could unfortunately not be obtained, but as the remaining experience represents the result of 12 years' careful registration, under very strict supervision, the figures are entitled to some weight. The special method used in computing the population "at risk" at the various ages is discussed in 1881 report and need not here be entered upon.

TABLE I.—Mortality experience of the Proclaimed Clans (North-West Provinces), 1876-91.

Deaths out of 10,000 at risk during the first 12 years.

The nature of the returns renders the rates of female mortality inapplicable to average Indian communities and they have not therefore been used. From the figures showing the male mortality at each age, the following results have been deduced, the figures having been subject to some slight graduation, to remove the accidental irregularities in the original facts.

TABLE III.—Showing Number of Male Children living at each Age out of a constant Number of 100,000 annual Births.

Age.	Numbers living.	
	Unadjusted.	Adjusted.
At birth	100,000	100,000
0-1	76,830	76,830
1-2	67,442	67,442
2-3	62,121	62,121
3-4	58,716	58,711
4-5	56,273	56,276
5-6	54,523	54,453
6-7	53,067	53,060
7-8	52,027	51,984
8-9	51,205	51,129
9-10	50,427	50,416
10-11	49,792	49,782
11-12	49,209	49,184

From the last table is deduced by a process of interpolation the following:—

TABLE IV.—Life Table (Males).

Age <i>x</i> .	Living at Age <i>x</i> .	Dying between Ages <i>x</i> and <i>x</i> + 1.
0	100,000	28,815
1	71,185	6,846
2	61,339	4,130
3	60,209	2,830
4	57,371	2,093
5	55,283	1,583
6	53,700	1,223
7	52,477	949
8	51,525	773
9	50,755	665
10	50,090	612
11	49,475	594
12	48,891	—

This table was taken to represent the normal or average rate of male mortality at these ages in each province, but as the rates for the period 1881-1891 (which are those represented in the final Tables D. to Q.), were much below the average throughout the period of adult life, except in the province of Bengal, a reduction of 10 per cent. was made from the above rates of mortality in remaining provinces. The resulting rates are nearly similar to those that would have been obtained by excluding from the above table the famine year, 1879-80, and giving half weight to the exceptionally unhealthy year, 1884-5.

ADULT RATES OF MORTALITY FOR THE PERIOD 1881-91.

Having obtained, in the manner above described, the tables showing the average age distribution for each province, these adjusted results were made use of to obtain similar adjusted age tables for 1881 and for 1891 separately. The latter tables, when combined with the observed rates of increase in the population during the decennium, give immediately the number living at each age x at the 1881 Census, and the number of these surviving at age $x+10$ in 1891. The ratio of these numbers (when corrected for the effects of emigration and immigration) gave the probability of surviving 10 years ${}_{10}P_x$ for each age, from which function it was easy to pass by simple processes of interpolation to the probability at each age of surviving a year aP_x and of dying in a year aQ_x ; the latter function (which is usually known as the "rate of mortality at age x ") being the basis of the mortality tables.

Before, however, the age tables can be used to determine the mortality of the intervening period in the manner above described, they must, where necessary, be corrected for the effects of migration.

In the 1881 investigation an estimate was made of the average annual migration in and out of each province, and of its effect upon the normal rates of increase. This involved the assumption that emigration took place nearly uniformly at all ages. On the present occasion a somewhat different method has been pursued, which can best be described by setting out in full the procedure in the case of the single province of Madras. The birthplace returns in 1881 and 1891 enable us to say approximately how many persons born in each province were at the time of the census living in other parts of India, and, conversely, how many persons born outside each province were at the time of census residing within it. These we may term the emigrants and immigrants respectively.

In the case of Madras, dealing with the male population only, in which during the 10 years the observed increase was 15.481 per cent., the following tabular statement shows the whole process:—

Migration.—Madras (Male Population), 1881-91.

1881. Enumerated in present area of province	-	15,257,401
Emigrants (other than Ceylon, &c.)	-	237,323
" (Ceylon)	-	253,000
" (Cochin and Travancore)	-	85,651
[not known in 1881, but taken as = 1891 figures $\div 1.15481$]		
		<hr/>
		575,974
less immigrants	-	125,590
		<hr/>
net emigrants, 1881	-	450,384
		<hr/>

(= 2,952 per 100,000 of population.)

1891. Enumerated in province - - - 17,619,39

[115,481 for each 100,000 in 1881.]

Emigrants (other than Ceylon, &c.) - 271,681

" (Cochin and Travancore) - 98,910

" (Ceylon) - 292,164

[not known in 1891, but taken
as = 1881 figures \times 1.15481]

662,705

less immigrants - - - 153,405

net emigrants, 1891 - - - 509,300

(= 2,890 in population of 100,000 or 3,338 in 115,481.)

The average excess of emigrants during the period 1881-91 has been, therefore, 479,840, and if we assume that these are subject on the average to a rate of mortality of 3 per cent. (a rather low estimate), the net emigration required to maintain these numbers during the 10 years, and to provide an annual increase of 5,900, would amount to about 22,000 per annum.

The following table summarises the results obtained for the various provinces as respects the male population, though from the differences in several cases between the 1881 and 1891 figures any conclusions that may be drawn from the table are of doubtful value. To facilitate comparison, the figures are all reduced to the radix of a population of 100,000 in 1881:—

TABLE V.

Province.	1881.			1891.			Estimated Net Annual Emigration — or Immi- gration +.
	Male Population.	Net Emigrants.	Net Immigrants.	Male Population.	Net Emigrants.	Net Immigrants.

* Allowing for additional rate of increase of 6 per cent. per decennium, estimated to obtain in the native population of the three provinces.

These figures (Table V.) appear to show that in Bengal there is practically so near a balance of emigration and immigration that no correction of the age distribution is required.

In Bombay and the Punjab the figures at the two censuses are not accordant, although in each case there is an excess of immigrants. These, in the case of Bombay, appear to have increased considerably during the 10 years while in the Punjab. On the other hand, they have been reduced by more than 50 per cent., and, taking the figures as they stand, they point practically to a balance of emigration and immigration during the 10 years in the latter province. It is not probable, however, that the change in the figures represent the actual facts in either case, and the estimated net annual immigration has in the case of these provinces been based on the assumption that the net immigrants bore the same proportion to the population at both censuses, that proportion being derived from a mean of the 1881 and 1891 figures.

On the whole there is so much uncertainty in the case of both these provinces as to the actual movement of population during the 10 years, that it is doubtful if anything would be gained by correcting the age tables on account of it.

In Madras and the North-West Provinces, however, the effect of the undoubted emigration that has taken place has been allowed for in the following manner:—The net emigrants of 1881 and 1891 are added to the population returns for these years, the sum representing the total native population of each province at these dates, whether resident in the province or elsewhere in India, and thus constituting a homogeneous community, in which the living at the various ages in 1891 are precisely the survivors (unaffected by migration) of those living at ages 10 years younger in 1881.

It remains still, however, to determine the ages of the emigrants thus added to the enumerated population of these provinces for 1881 and 1891. There is no direct means of doing this, but the following method gives results probably sufficiently near to the truth.

A reference to Table VI. will show at a glance in which provinces and to what extent immigrants exceed emigrants, and vice versa. It will be apparent that in three provinces in particular, Coorg, Burma, and Berar, there is a very large immigrant population. The Bengal and Central Province States might be included in this category, but that the recorded immigrants in these cases no doubt consist largely of persons whose birthplace was described in error as "Bengal" or "Central Provinces," in lieu of "Bengal States" or "Central Province States." These two cases may therefore be dismissed, leaving the three provinces first named. We may fairly assume that but for immigration the age distribution in these provinces would probably differ little from that in the remainder of India. The immigrants, however, disturb this normal age distribution in two ways, first, and mainly, a constant addition of fresh entrants at the younger adult ages, and in a minor degree by consequent increase in the birth rate, and therefore in the rate at which the native population is itself increasing. The preceding Table (Table VII.) shows the process by which the immigrant population at the various age groups has been estimated. Columns (2), (3), (4), show the male population corresponding to a native population of 10,000 in each of the three provinces, giving a total for the three of 38,628 of whom 30,000 are natives and 8,628 immigrants. The further columns show the estimated age distribution of the former number based upon an average of the Indian provinces, but allowing for an annual rate of increase of 6 per mille in excess of the rate in India generally. The subtraction of these 30,000 natives leaves us with the 8,628 immigrants distributed over the various age groups as shown in column (9). This age distribution may be assumed to apply, with such approximation as the data will permit, to the migrant population in India generally.

The application of the Table will be seen from the following scheme in the case of the Madras and North-West Provinces, all the figures being reduced to the common standard of a population of 100,000 males living in 1881 as in Table C. The columns of emigrants consisting simply of the figures in column (9), Table VII., reduced proportionately at all ages.

In Bengal the proportionate population at the various periods of life was, on the whole, so similar in 1881 and 1891, that it was assumed that the adjusted numbers the age-distribution at each Census. The adjustment of the figures in respect of the male population for the remaining provinces is separately given for 1881 and 1891 in Table IX., the actual figures being reduced for the purpose of comparison to represent a mean population during the decennium of 100,000 males in each Province.

From these results the rates of mortality for adult male life given in the Life Tables (D. to Q.) were deduced, being made to join on smoothly to the rates for the younger ages obtained, as already explained, from the "proclaimed clans" data.

TABLE IX.—Adjusted Numbers of Males living in 1881 and 1891 at the following Ages, corresponding to an Average Male Population of 100,000 during the Ten Years in the under-mentioned Provinces.

Age last Birthday.	MADRAS.		BENGAL.	BOMBAY.		NORTH WEST PROVINCES.		PUNJAB.

THE FEMALE TABLES.

Hitherto I have dealt in detail only with the male age tables. For reasons which were fully discussed in the 1881 Report, both in the chapter for which I was responsible and in the special chapter dealing with sex in the general Report, it is extremely doubtful as to how far the age tables of the female population are complete or sufficiently trustworthy in most of the Provinces to be employed independently as the bases for life tables. It has seemed best, therefore, to proceed as in 1881, and by taking as a starting point the Provinces of Madras and Bengal (Madras alone was used in the previous Report), where the ratio of the females enumerated to the males is nearly normal, to investigate the relation of female and male mortality in these Provinces, and to apply the results to the remaining Provinces, assuming the difference in the mortality of the sexes at various periods of life is similar throughout India.

The following table gives a comparison of the male and female population at various age groups in Madras and Bengal, the numbers being reduced in each case to a radix of 100,000 males. The ratio of females to males given in the table for Madras differs somewhat from that obtained directly from the Census returns since the effect of the larger emigrant male population must be allowed for. This is done as shown in the following statement:—

	Males	Females
Population enumerated in Madras in 1891 (reduced to radix of 100,000 males)	100,000	102,277
Emigrant population enumerated in other parts of India (unbalanced by immigrants)	2,890	584
	102,890	102,861

It will be seen, therefore, that when the effect of the greater male emigration is taken into account there is an almost exact balance of the sexes in the Madras-born population. A nearly similar result holds in Bengal (where the balance of migration is insignificant), 101,654 females being enumerated to 100,000 males, a difference of less than 1 per cent. Table X. gives the ratio of females to males for certain age-groups, selected with a view of avoiding the quinquennial ages. The ratio at birth is based on the assumption that 104 males are born to every 100 females, this being the ratio shown by the Madras Province registration returns, and not differing much from that given by the "proclaimed clans" statistics, where the ratio for the 15 years 1876-91 has been about 105½ to 100.

TABLE X.—Showing Number of Females to 1,000 Males, at the under-mentioned Ages, in Madras and Bengal, 1891 (Native Population).

Age Group.	Middle Age of Group.	Madras Province.	Bengal Province.	Mean of both Provinces.	Adjusted Number for Middle Age of Group.
At Birth	0	982	982	982	982
0—4	2½	1,013	1,045	1,030	1,026
5—9	7½	1,004	985	994	1,000
10—14	12½	917	916	916	916
15—19	17½	992	1,036	1,014	1,006
20—24	22½	1,135	1,243	1,189	1,105
25—29	27½	1,212	1,387	1,299	1,221

the numbers will be seen to follow the same general law of individual differences and the departure from the ratio at the extreme ends of the ratio at the certain

given in Table XI., and by means of them the female ago tables were adjusted, the results appearing in Table (B.) by the side of the adjusted male populations. Remembering that a rise in the curve means a lower mortality, and conversely a fall in the curve indicates a higher mortality than that prevailing among the male population at the same ages, it will be seen from an inspection of the figures in the table that the rate of mortality is much lower among the females in the first year or so after birth, but that the difference between the sexes diminishes until about age 6-7, when the mortality is the same. From this point the females die off more rapidly, the greatest differences in the rates being found between 15 and 20, after which the female mortality again approaches the male, until at age 36 they are once more equal, the proportion of females to males at this age, 949 : 1,000, being lower than at any other period of life. After age 36 female mortality is lower than male for the remainder of life, and as a consequence the proportionate number of females living continues to steadily increase. At these higher ages, and indeed generally throughout the table, the ratios shown by the Madras figures have mainly been followed as being undoubtedly the more trustworthy, and a general comparison of the figures with the unadjusted results in Table IX. is given by the last column in that table. Speaking generally the difference in the average duration of male and female life at various ages is similar to the differences found in 1881. The mortality in all the Provinces but Bengal being considerably below the average during the decennium, the differences of the mortality of female and male life, as given in Table X., were reduced by 10 per cent. for those provinces.

TABLE XI.—Showing Number of Females living to 10,000 Males (adjusted Numbers), at the under-mentioned Ages last birthday, on the assumption of 104 Male Births to each 100 Female.

Age last Birthday.	Females to 10,000 Males.	Δ	Age last Birthday.	Females to 10,000 Males.	Δ

39	9,498	12	79	13,087	131

[Note.—After age 60, the numbers form a geometrical progression, obtained on the assumption that the probability of surviving a year at each age is 1 per cent. greater for female than for male life.]

GENERAL RESULTS.

Duration of Life.

The general results of the investigation into the 10 years' mortality experience of India and the probabilities of life derived therefrom are, of course, to be found in the mortality tables annexed, and more especially in the summary given in Table XII. of the expectations of life for decennial ages. It will be well, however, to indicate briefly their bearing.

For India, as a whole, the results do not differ materially from those arrived at 10 years ago, the expectation of life being, however, somewhat larger by the present tables. Here it is necessary to repeat that the 1881 tables showed the normal mortality taken over a long series of years, including famine periods, but that the 1891 tables show the mortality of the decade only, an exceptionally favourable period, except in Bengal. The results, speaking generally, show a marked improvement in Madras and Bombay, an improvement somewhat less pronounced in the North-West Provinces and the Punjab, and a decided falling off in Bengal. The following is a comparison, with respect to male life, of the expectation of life at birth (or mean duration of life) according to 1881 and 1891 tables:—

Province.	Expectation of Life at Birth (Males).			
	1881.	1891.	Increase.	Decrease.
Madras - - - -	22.35	26.92	4.57	—
Bengal - - - -	24.50	22.78	—	1.72
Bombay - - - -	23.04	26.12	3.08	—
N.-W. Provinces - - - -	23.10	24.45	1.35	—
Punjab - - - -	24.80	26.58	1.78	—
India - - - -	23.67	24.59	0.92	—

These results are in agreement with what might have been anticipated from the large rate of increase of the population in Madras and Bombay; the rates somewhat smaller (but nevertheless much above the normal rates of increase for those provinces), shown by the Punjab and North-West Provinces; and, on the other hand, by a rate in Bengal which, in spite of a very heavy birth rate during the period, is slightly below the normal.

Birth and Death Rates.

Partly as a check upon the general results, and also as a matter of interest in itself, an independent estimate was made as to the birth and death rates of the various provinces during the decade based merely upon the numbers of children under 10 enumerated in 1891 for each 100,000 of population. The average annual birth rate between 1881 and 1891, giving the required number of survivors under 10 in 1891, was computed by employing the rates of mortality in the tables; and the average death rates for the same period obtained by deducting the corrected annual rates of increase. The results will be found in Table XII., and the following comparison of the death rates for both sexes with the mean death rates deduced in 1881 is instructive.

Province.	Death Rates per mille (both Sexes).			
	1881.	1891.	Increase.	Decrease.
Madras - - - -	44.5	36.0	—	8.5
Bombay - - - -	42.5	35.4	—	7.1
N.W. Provinces - - - -	41.9	37.7	—	4.2
Bengal - - - -	39.9	44.8	4.9	—
Punjab - - - -	39.2	36.0	—	3.2

It will be seen that the death rates in Madras and Bombay have declined nearly 20 per cent., and in the North-West Provinces and the Punjab by nearly 10 per cent., while in Bengal there has been an increase of about 12 per cent., conclusions in fair accordance with the differences between the present and former tables of mortality above referred to.

The cause of the improved death rates in the four provinces named is not far to seek. All these provinces suffered from famine only a few years prior to the census of 1881, Madras and Bombay most severely, the Punjab least so. It is natural to suppose that the weakly suffered the heaviest mortality during the famine, and that the survivors on the whole were above the average in vitality. Add to this cause the further one of an absence practically of famine during the succeeding 10 years and the light mortality, especially in Madras and Bombay, is fully accounted for. A consequence of this light mortality is an increase in the proportion of old people in these provinces (as shown in Table C.), which is also accompanied by an increased number of children, due to the rebound of the birth rate subsequent to the famine.

TABLE XIII.—Summary Table showing for every Tenth Year of Age the “Expectation of Life,” or “Mean after Lifetime,” in the principal Indian Provinces (according to the Rates of Mortality experienced in the 10 Years 1881–91).
